

Dual function $g(\text{lambda1}, \text{lambda2})$ on the non-negative quadrant

g is concave: the map is one hill, summit $d^* = -4.250000$, gap $0.00\text{e}+00$.
Every point on it is a lower bound on p^* - weak duality.
 $\text{lambda2}^* = 0$ (red axis): the summit sits on the boundary, so constraint 2 is inactive.

lambda2
